## npm Configurations

npm can be configured in multiple ways:

- flags
- environment variables
- .npmrc files
- `npm config CLI`

The `npm config CLI` is the easiest way, so let's cover it and take a look at a few examples.

To list current configs:

```
npm config list  
npm config ls // list configs
```

To list global configs:

```
npm config --global list  
npm config -g ls
```

There are many configurations. For example `proxy` or `registry` are the most common ones especially if you are working at a big company that has a corporate proxy and a private (self-hosted) npm registry.

To set any config use `npm config set <key> <value>`. For example, to set the registry value use:

```
npm config set registry "http://registry.npmjs.org/"
```

You can read an individual setting value. For example to read the registry value use `npm config get registry`:

```
npm config get registry
```

To remove the setting (config), there's a `npm config delete <key>` command. For example, to remove email:

```
npm config delete email
```
